

ABI Band 4 (1.37 μ m)

Quick Guide

Why is the Cirrus Band **Important?**

The Cirrus Band (1.37 µm) is unique among the reflective bands on the ABI in that it occupies a region of very strong absorption by water vapor in the electromagnetic spectrum. It will detect very thin cirrus clouds during the day. In the image at right of a Supercell thunderstorm over Oklahoma, low-level cumulus clouds east of the system are only faintly visible because energy at 1.37 µm has been absorbed as it moves through the moist atmosphere.

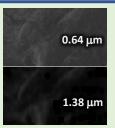

ABI Channels in the near Infrared

ABI Band	Central Wavelength (μm)	Band Nickname	Туре	Resolution
4	1.37 μm	Cirrus	Near-Infrared	2 km
5	1.61 μm	Snow/Ice	Near-Infrared	1km
6	2.24 μm	Cloud phase	Near-Infrared	2 km

Impact on Operations

Primary Application: This channel detects high clouds during the day time. Very thin cirrus can be discerned.

Application: In a dry atmosphere, this band will detect highly reflective features, such as dust, or clouds, if there is limited water vapor above those features.

Application: The Cirrus Channel is an important part of the Daytime Cloud Mask computation because of its ability at detecting very thin cirrus.

Limitations

Daytime only

application: The 1.37 µm band detects reflected visible

solar radiation.

Limitation: Theory suggests that about 12 mm of Total Precipitable Water is sufficient to absorb most of the solar radiation at 1.37 µm. Variable amounts of moisture in the atmosphere (and where in the vertical that moisture exists) influence how far down the satellite can see at this wavelength.

The Cirrus Channel is one of two near-infrared channels on ABI with 2-km resolution.

ABI Band 4 (1.37 μm)

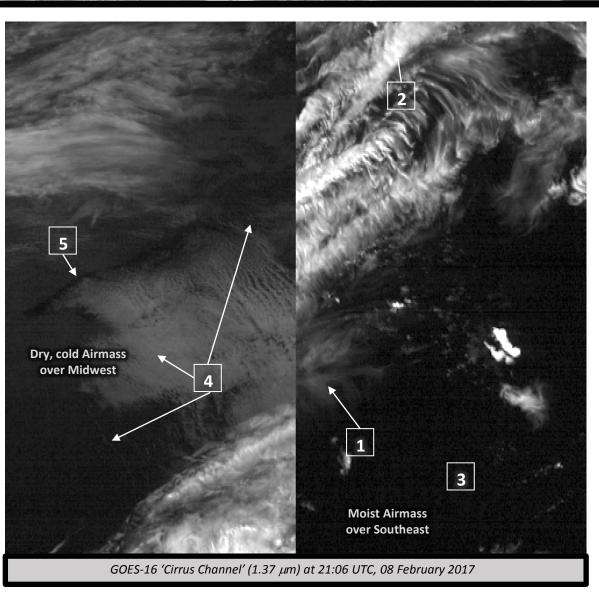

Cirrus Band

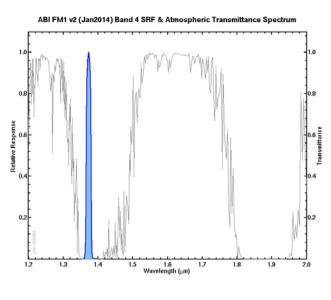

Image Interpretation

- Thin cirrus easily detectable
- Thick cirrus shows up easily
- Low Clouds are not detected in a moist atmosphere
- Low clouds visible in dry atmosphere
- Coastlines visible in dry air

The Spectral Response
Function for the Cirrus
Channel is shown in blue at
left. The grey line shows
transmittance through the
atmosphere. The Cirrus
Channel is in a region
where strong absorption
(by water vapor) occurs.
